MADISON, Wis. – The Wisconsin Department of Agriculture, Trade and Consumer Protection (DATCP) confirms that a deer farm in Langlade County has tested positive for chronic wasting disease (CWD).

A positive sample from a 1-year-old doe was confirmed by the National Veterinary Services Laboratory in Ames, Iowa. All 57 deer at the 6-acre farm were already under quarantine after receiving animals from a CWD affected farm. The herd will remain under quarantine while an epidemiological investigation is conducted by DATCP and U.S. Department of Agriculture (USDA) veterinarians and staff.

CWD is a fatal, neurological disease of deer, elk and moose caused by an infectious protein called a prion that affects the animal's brain, and testing for CWD is typically only performed after the animal's death. DATCP regulates deer farms for registration, recordkeeping, disease testing, movement and permit requirements.
